

FIRE ALARM SYSTEMS

Entech provides a comprehensive approach

The rapid evolution of fire alarm systems in the last decade has taken us from simple zoned systems to analog multiplex systems; from “dumb” smoke detectors to analog addressable initiating devices; from “relay” panels to networked, micro-processor based panels.

Entech Sales & Service, Inc. is dedicated to the protection of life and property through the sale, installation, service and maintenance of fire alarm systems. Entech offers a comprehensive solution to meet your life safety and code compliance needs.

What Services does Entech Offer?

Code Consulting

After evaluating your facility, applicable city and state codes and other driving forces, Entech can provide you with an outline of required system design features. Requirements for ADA compliance and other special needs will also be identified at this stage. Helping you reach a balanced, informed decision and arrive at a plan for implementation of a new or retrofit system is what Entech can do for you.

System Design

Building on our research of your facility, Entech can provide you with a system plan that will meet your needs. Planning to renovate or expand your property? Designing expandability into your system is just one more reason you should not rely on a “design” from the lowest bidder. Entech takes the responsibility of designing your life safety system seriously. As your design consultant, Entech is not motivated to provide the “least” system, simply the right system.

System Installation

Entech provides fire alarm system construction ranging from small fire sprinkler-monitoring systems to large, fully integrated, building-wide detection and control systems that incorporate detection, control, and supplemental building system integration.

Inspection, Testing and Maintenance

According to code, all smoke detectors must be visually inspected twice yearly, tested annually for functionality, and sensitivity-tested to ensure their specified range within one year of installation and bi-annually, thereafter.

Entech’s licensed service staff is trained in all major manufacturers’ systems. We have the expertise to keep your existing system performing within factory parameters and maintain your compliance with state requirements for annual detector sensitivity testing.
